Outline

- The family
 - Brief historical review
 - Marriage and family today
- Sexuality
 - Three dimensions of sexuality
 - 2006–2008 NSFG sexuality data
 - Empirical analyses of sexuality
- Family partnering

The family

- The family is one of the most important foundations and agents of socialization
 - The family is the first place we learn culture, norms, values, and gender roles
 - Usually where fertility occurs (production of children)

Family constitution

- Family constitution varies across cultures and over time
 - The Western world traditionally regarded a family as consisting of a husband, wife, and children
 - Increasing number of one-parent families, gay and lesbian families, blended families, childless families
 - Descent system: bilineal (U.S.), patrilineal (China)

Brief historical review

- Polygyny was banned around the 12th century, and extended families declined in number
- Up to around the 17th century, marriages were used mainly to
 - Gain ancestral legitimacy
 - Establish military, political, commercial, and economic alliances

Love match

- By the end of 18th century in Western Europe, the “love match” became normative
 - Husband providing for the family
 - Wife focusing on the family life
- In the U.S. during the colonial era, there were no sharply divided roles of the husband and the wife
 - The husband, wife, and children all worked together

Extended to nuclear families

- Societal and structural changes in Europe and the U.S.
 - Industrialization, urbanization, productivity, market economy, and individualization
 - Rural-urban migration: more adults working in factories and other non-familial settings
- Control and decision making moved from extended families to nuclear families
 - Decision-making became less based on familial connections

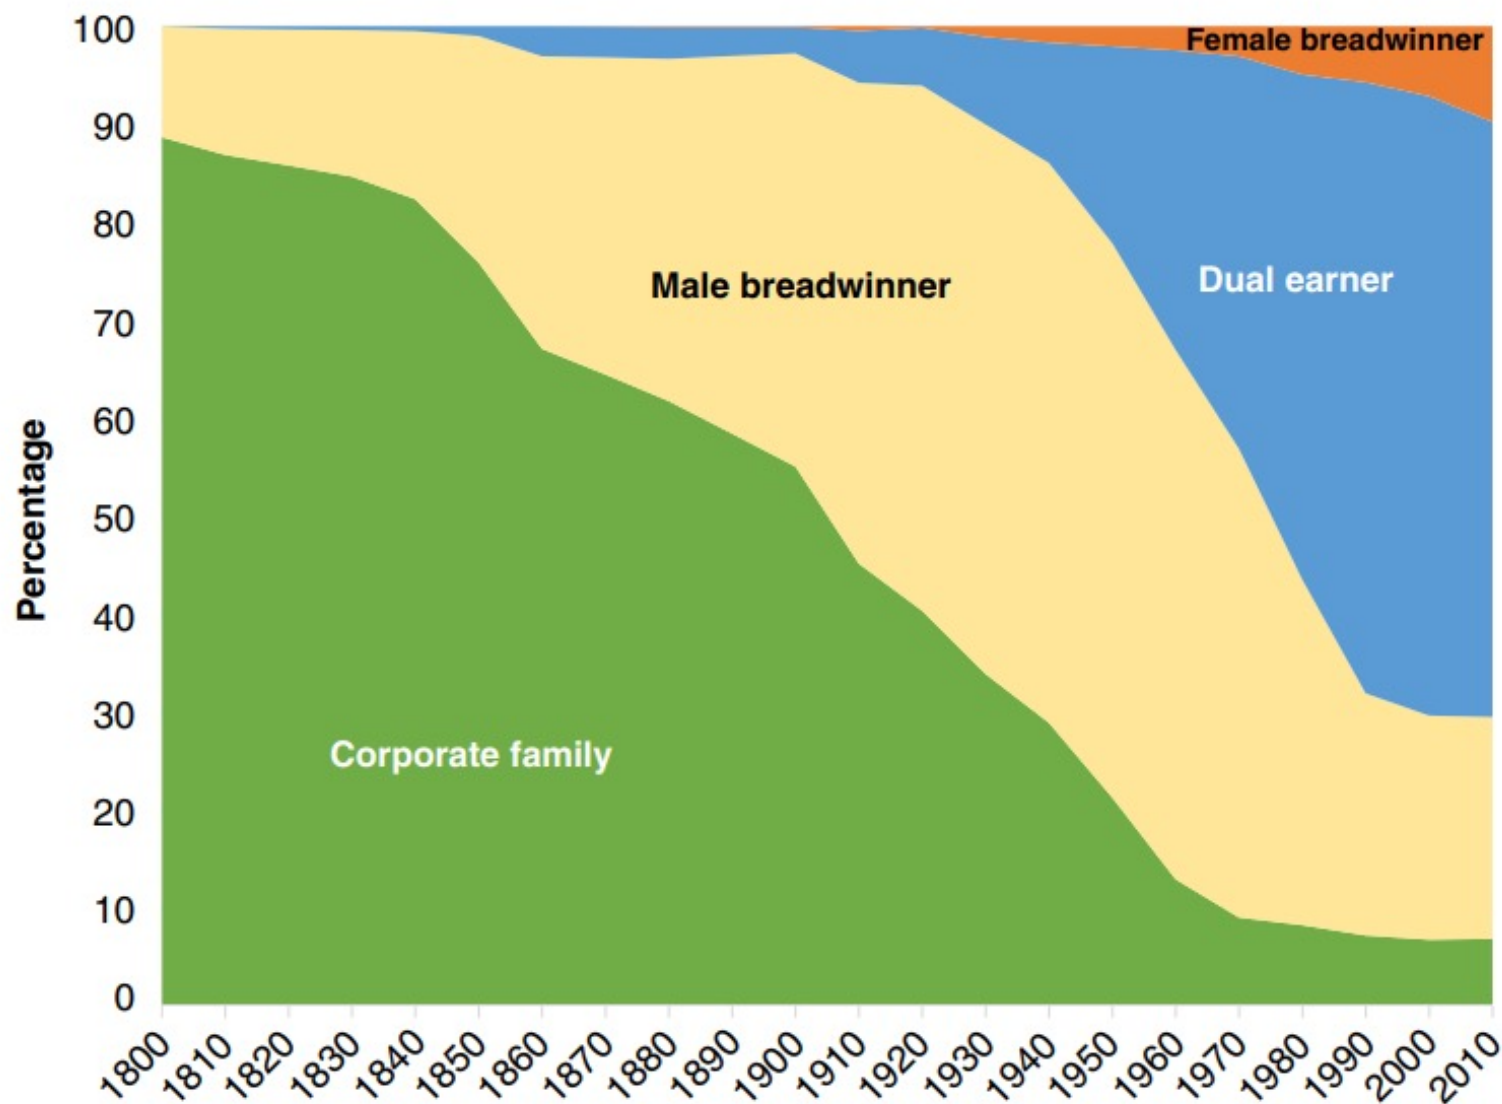

Fig. 4 Family economies of U.S. couples aged 18–64: United States, 1800–2010. *Source:* Ruggles (forthcoming)

Demographic changes in the U.S.

- Life expectancy at birth
- Age when women have last child
- Marriage and childbearing no longer defining events

Life expectancy at birth

- Life expectancy at birth in the U.S. increased
 - From 74 in the 19th century
 - To around 83 as of 2012

Age when women have last child

- The age when a woman would have her last child does not greatly impact her any more like it did in the 19th century
 - Women in the 19th century had 14 years of life remaining after they have raised their last child to age 15
 - Women today have 33 years of life remaining by the time they have raised their last child to age 15

Marriage and childbearing

- Marriage and childbearing are no longer defining events and activities of our lives
 - In earlier times, they were our identity
 - Today, they are a less central part of our life

Marriage and family today

- Focus on the United States
 1. How old are people today when they marry for the first time?
 2. How many people get married?
 3. How many people cohabit before marriage?
 4. How many babies are born to unmarried women?
 5. What are the trends of interracial marriage?

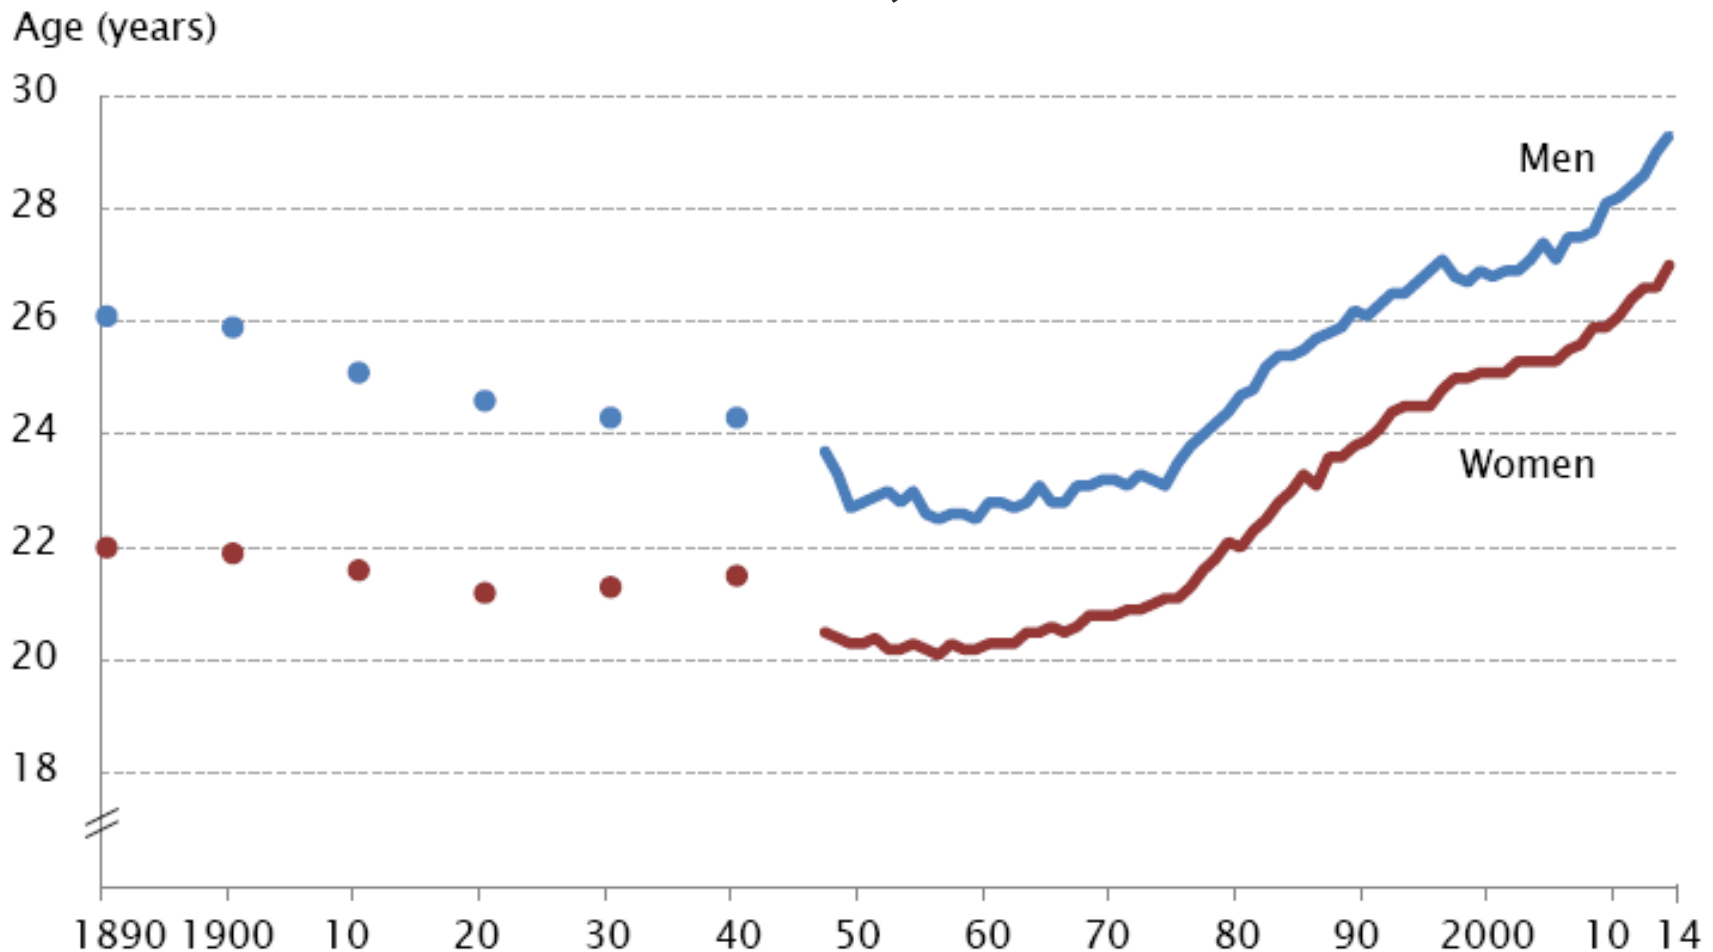

1. Age at first marriage

- Males at 26 years of age and females at 22 at the end of 19th century
- Males at 22.8 and females at 20.3 in about the year of 1960
 - Along with the growth of well-paid jobs under industrialization
- Increase in age at first marriage since 1960
- Males at 29 and females at 27 in 2014

Median age at first marriage, United States, 1890–2014

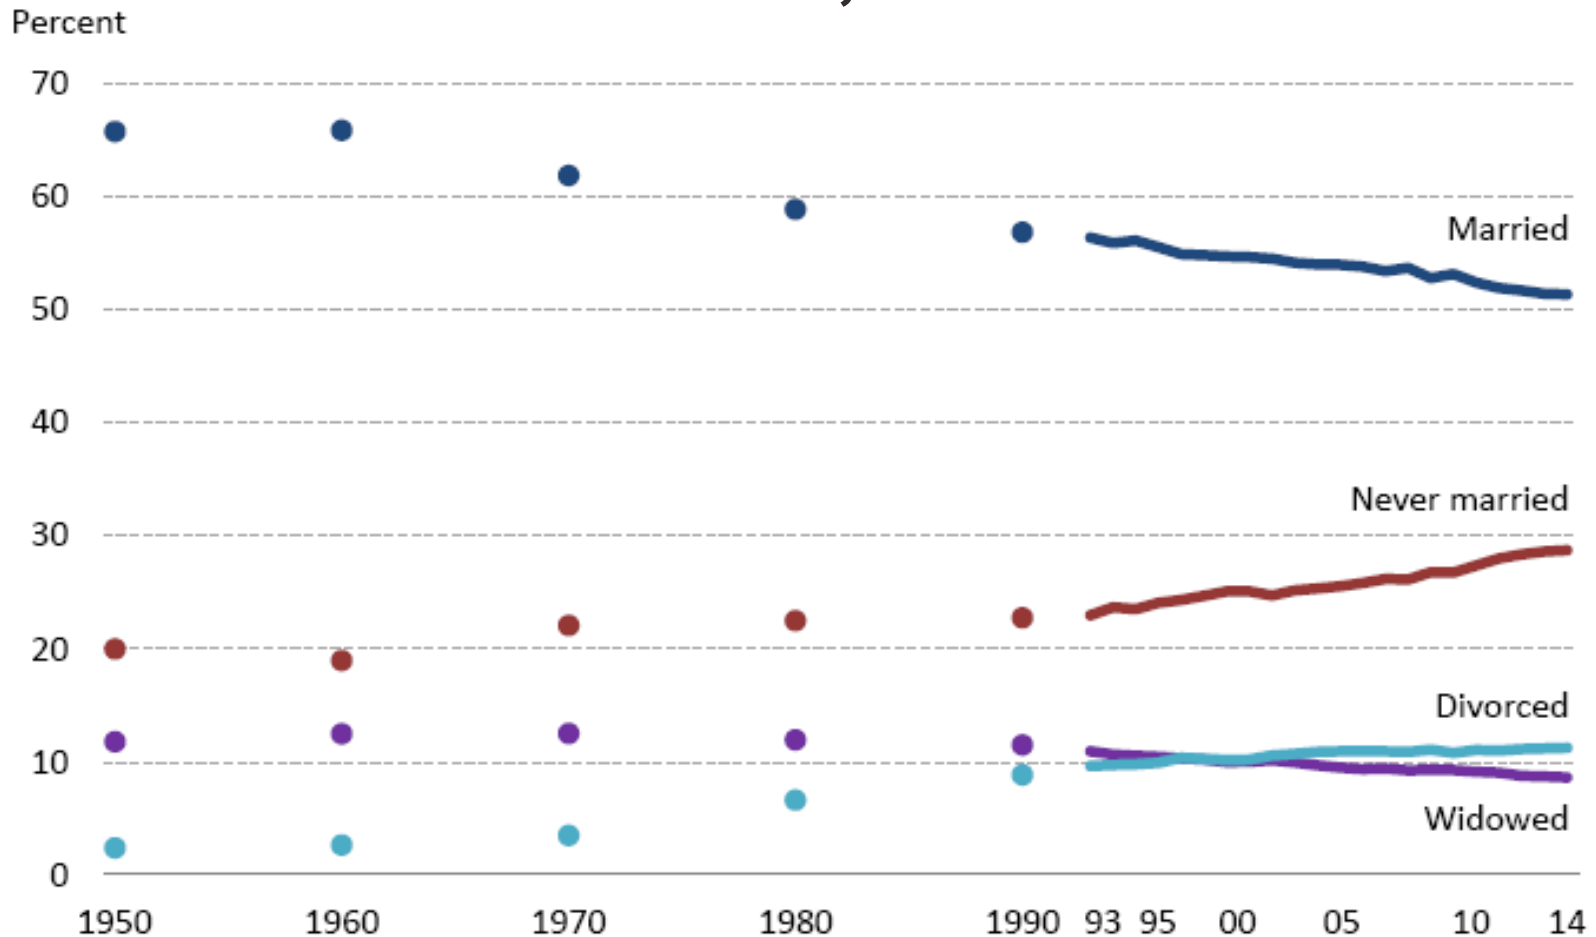

Source: U.S. Census Bureau, <https://www.census.gov/hhes/families/files/graphics/MS-2.pdf>

2. Marital status

- In 1950, among people of age 15+
 - 66% of women were married, 20% never married
 - 68% of men were married, 28% never married
- In 2014
 - ~50% of women were married, 39% never married
 - 52% of men were married, 35% never married
- Trends of age group 45–54
 - In 1980, 5% of women were never married
 - In 2010, 14% of women were never married
 - In 2030, 25% of women are projected to not be married (Pew Research Center)

Marital status of women 15+, United States, 1950–2014

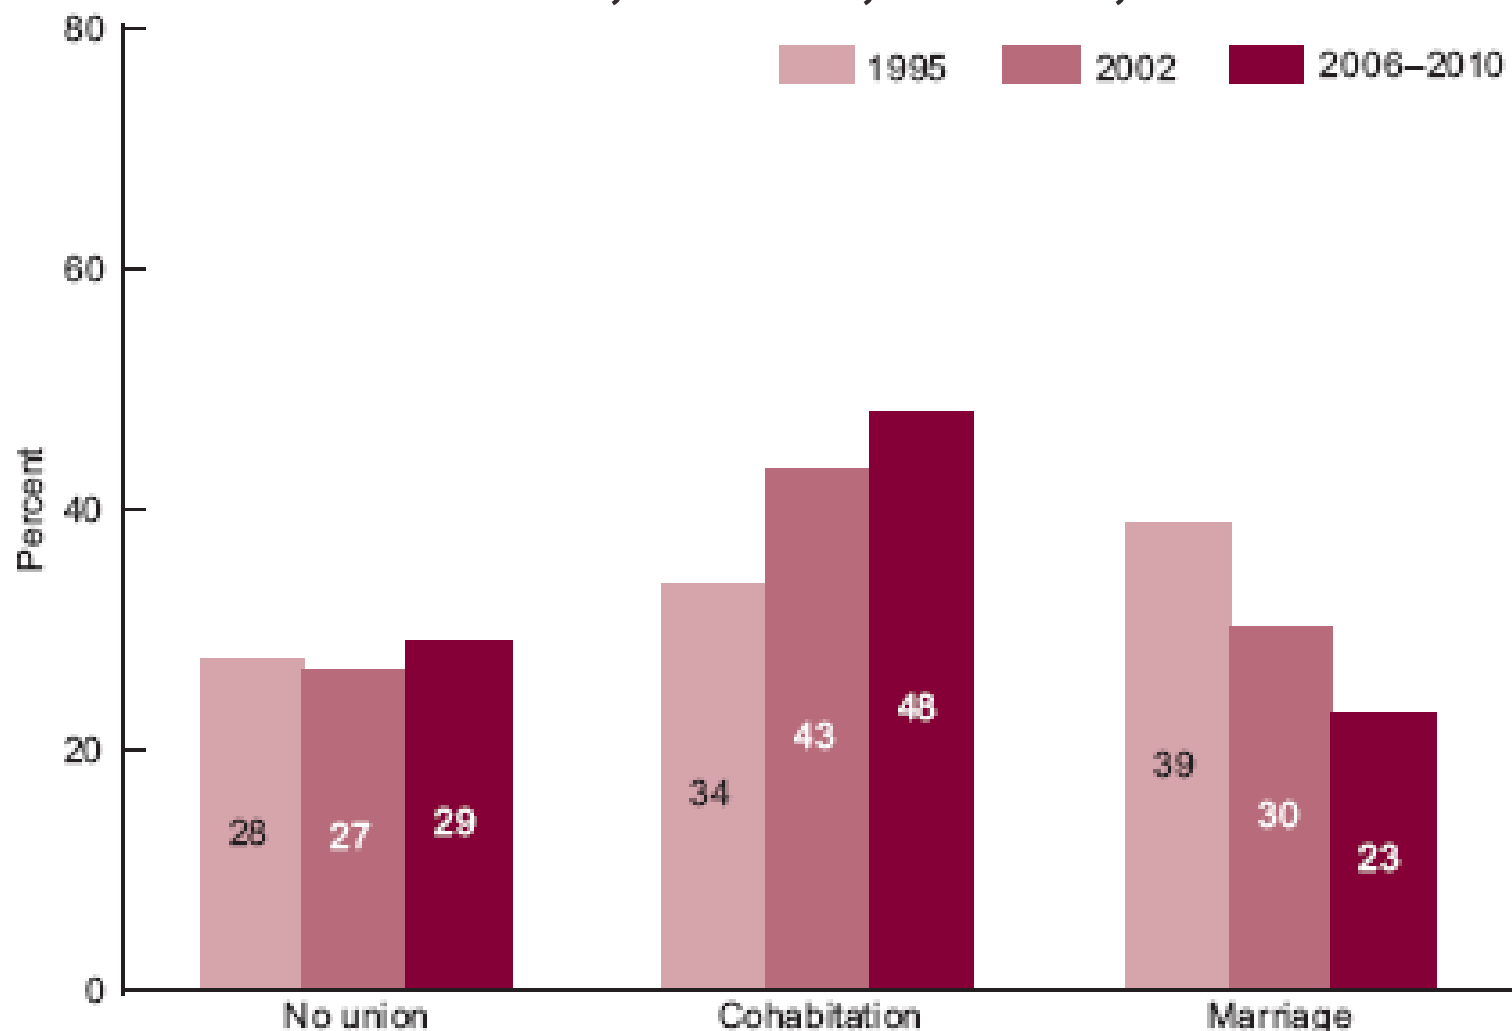

Source: U.S. Census Bureau. <https://www.census.gov/hhes/families/files/graphics/MS-1b.pdf>

3. Cohabiting before marriage

- First unions: cohabitation and marriage
 - Very little change between 1995 and 2010 (NSFG) in the percentages of women aged 15–44 not in a union: 28%
- Changes of women marrying and cohabiting
 - Cohabitation: 30% in 1995; 50% in 2006–2010
 - Marriage: 39% in 1995; 23% in 2006–2010
- Of the 50% of women cohabiting
 - 40% transitioned to marry, 32% remained cohabiting, and 27% dissolved the relationships
- Cohabiting without being married is becoming more acceptable

Type of first unions among women 15–44, United States, 1995, 2002, 2006–2010

Source: Copen, Daniels, and Mosher, 2013: 4.

Cohabiting through time

- Women aged 19–44 reported cohabiting prior to their first marriage (Manning, 2013)
 - 11% in 1965–1974
 - 46% in 1985–1989
 - 59% in 1995–1999
 - 66% in 2005–2010
- Cohabitation is the “new normal” these days

Percentages of women 19–44 who cohabited before their first marriage by marriage cohort, United States, 1965–1974 to 2005–2010

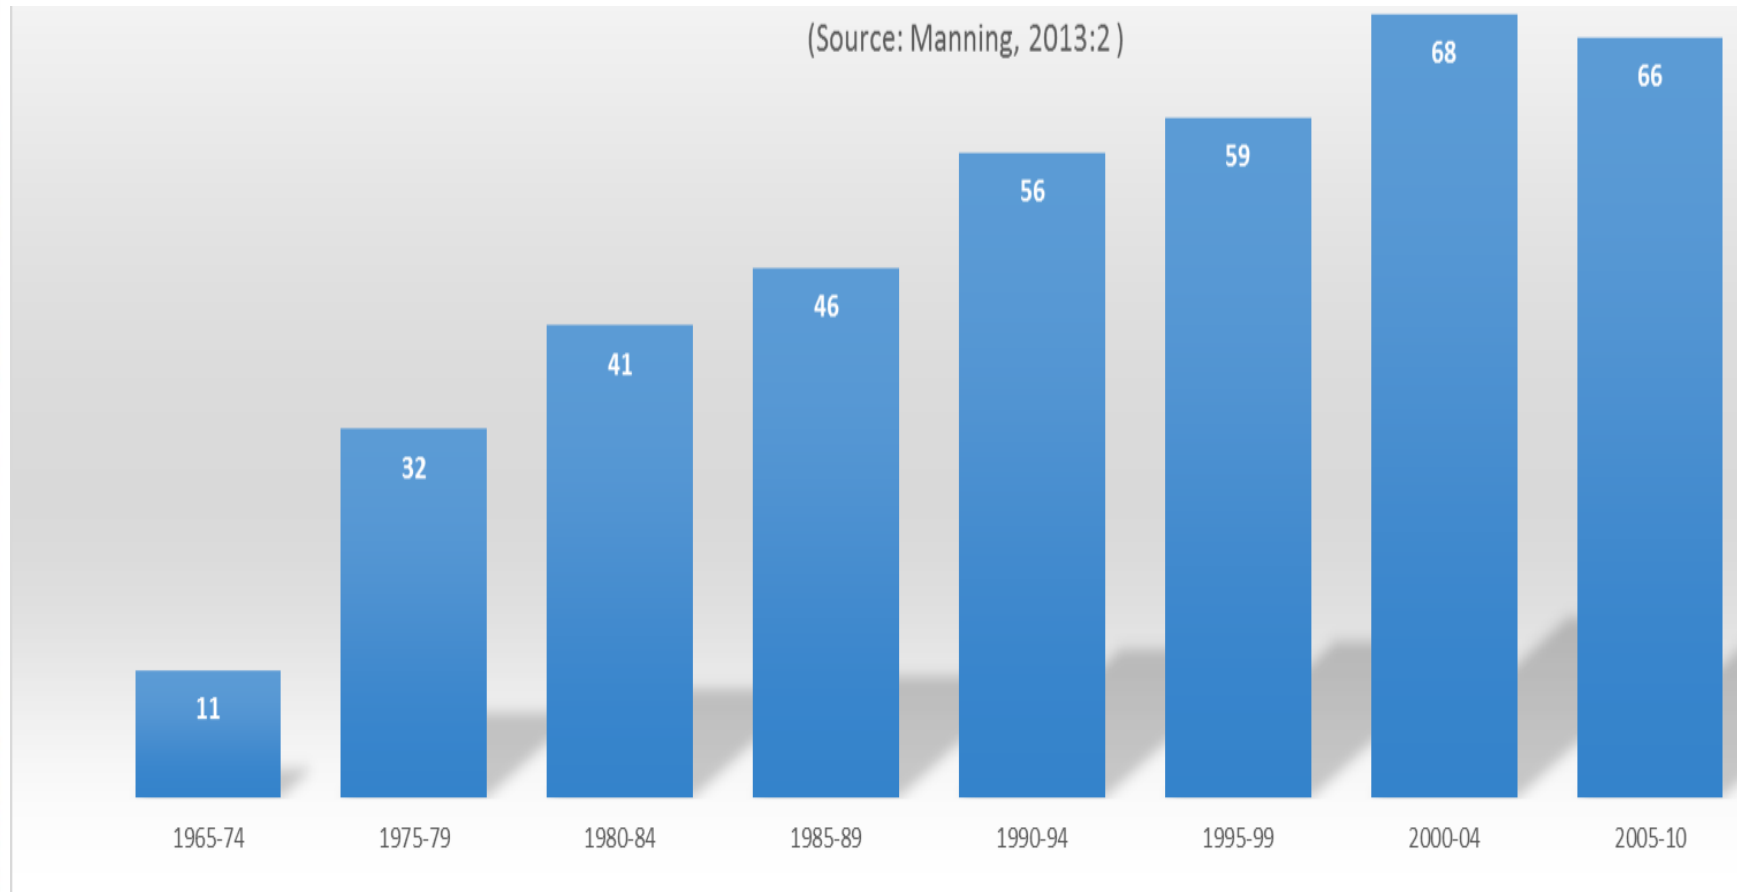

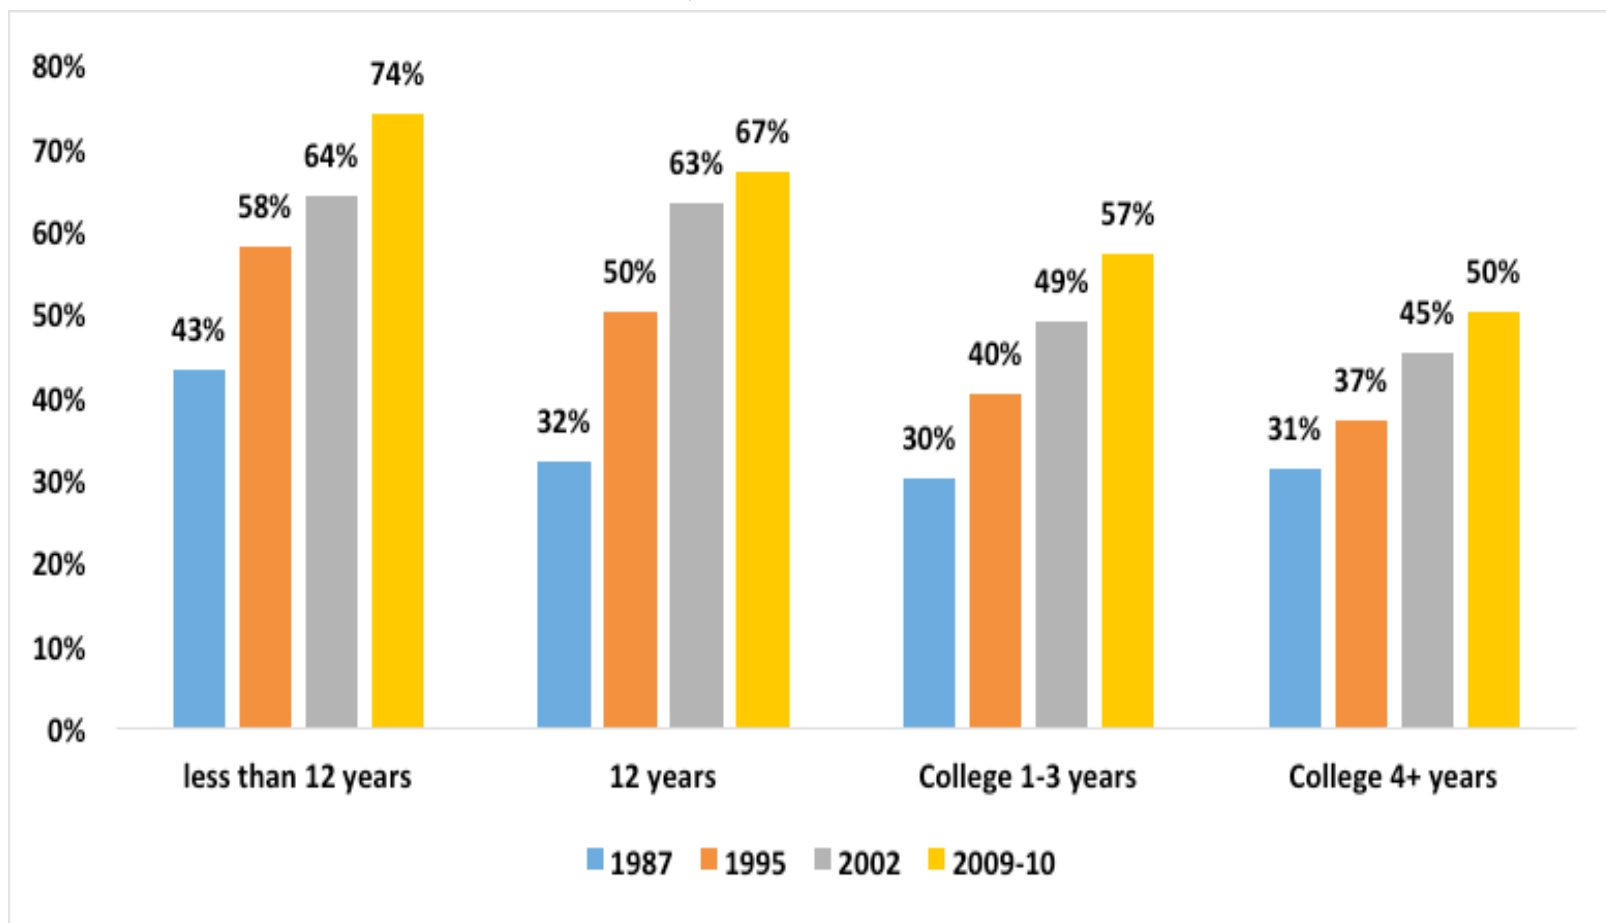

Figure prepared by Huanjun Zhang and DLP.

Cohabitation and education

- Different cohabiting rates by levels of education
- More educated women are less likely to cohabit
- In 2009–2010
 - 74% with less than a high school degree have ever cohabited
 - 67% with high school degree
 - 57% with one to three years of college
 - 50% with four or more years of college

Percentages of women 19–44 who have ever cohabited by level of education, United States, 1987 to 2009–2010

Source of data: Manning, 2013: 3.

Figure prepared by Huanjun Zhang and DLP.

Cohabitation and marital expectations

- “Stalled” second demographic transition
 - 18–24 single women have stronger expectations to marry than cohabit (2011–2015 NSFG)
- Among young women expecting to marry
 - 68% expect to cohabit with their future spouse
 - 32% expect to marry without cohabiting first
- Women from disadvantaged backgrounds report the lowest expectations to marry
- Variation by education
 - No education variation in cohabitation expectations
 - Marriage expectations do vary by education

4. Babies born out-of-wedlock

- Percentage of babies born to unmarried mothers
 - 5% in the late 1950s
 - 14% in the mid-1970s
 - 30% in the mid-1980s
 - 41% in 2013
- Homes for unwed mothers reduced in number
 - The legalization of abortion
 - Contraception widely available and effective
 - Increased percentages of single mothers
 - Changing societal attitudes toward single parenthood

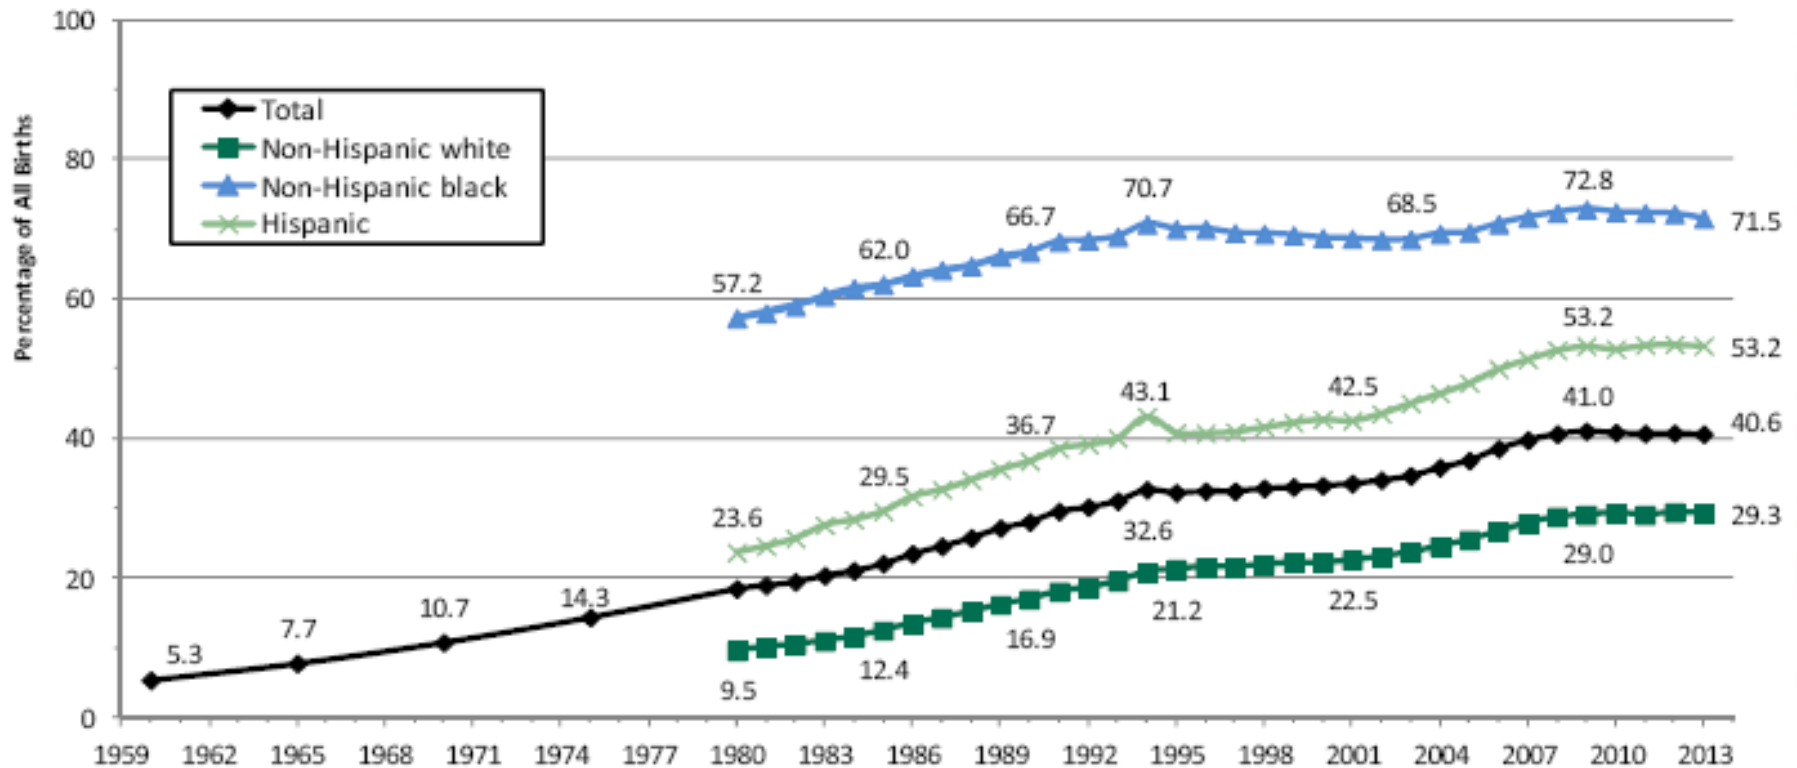

Race/ethnicity

- Births to unmarried mothers by race/ethnicity
- Non-Hispanic White women
 - 10% in 1980
 - 29% in 2013
- Non-Hispanic Black women
 - 57% in 1980
 - 72% in 2013
- Hispanic women
 - 24% in 1980
 - 53% in 2013

Births to unmarried women by race/ethnicity, United States, 1959–2013

Source: Child Trends, 2015: 3 (reprinted with permission of Child Trends).

Unmarried Black women

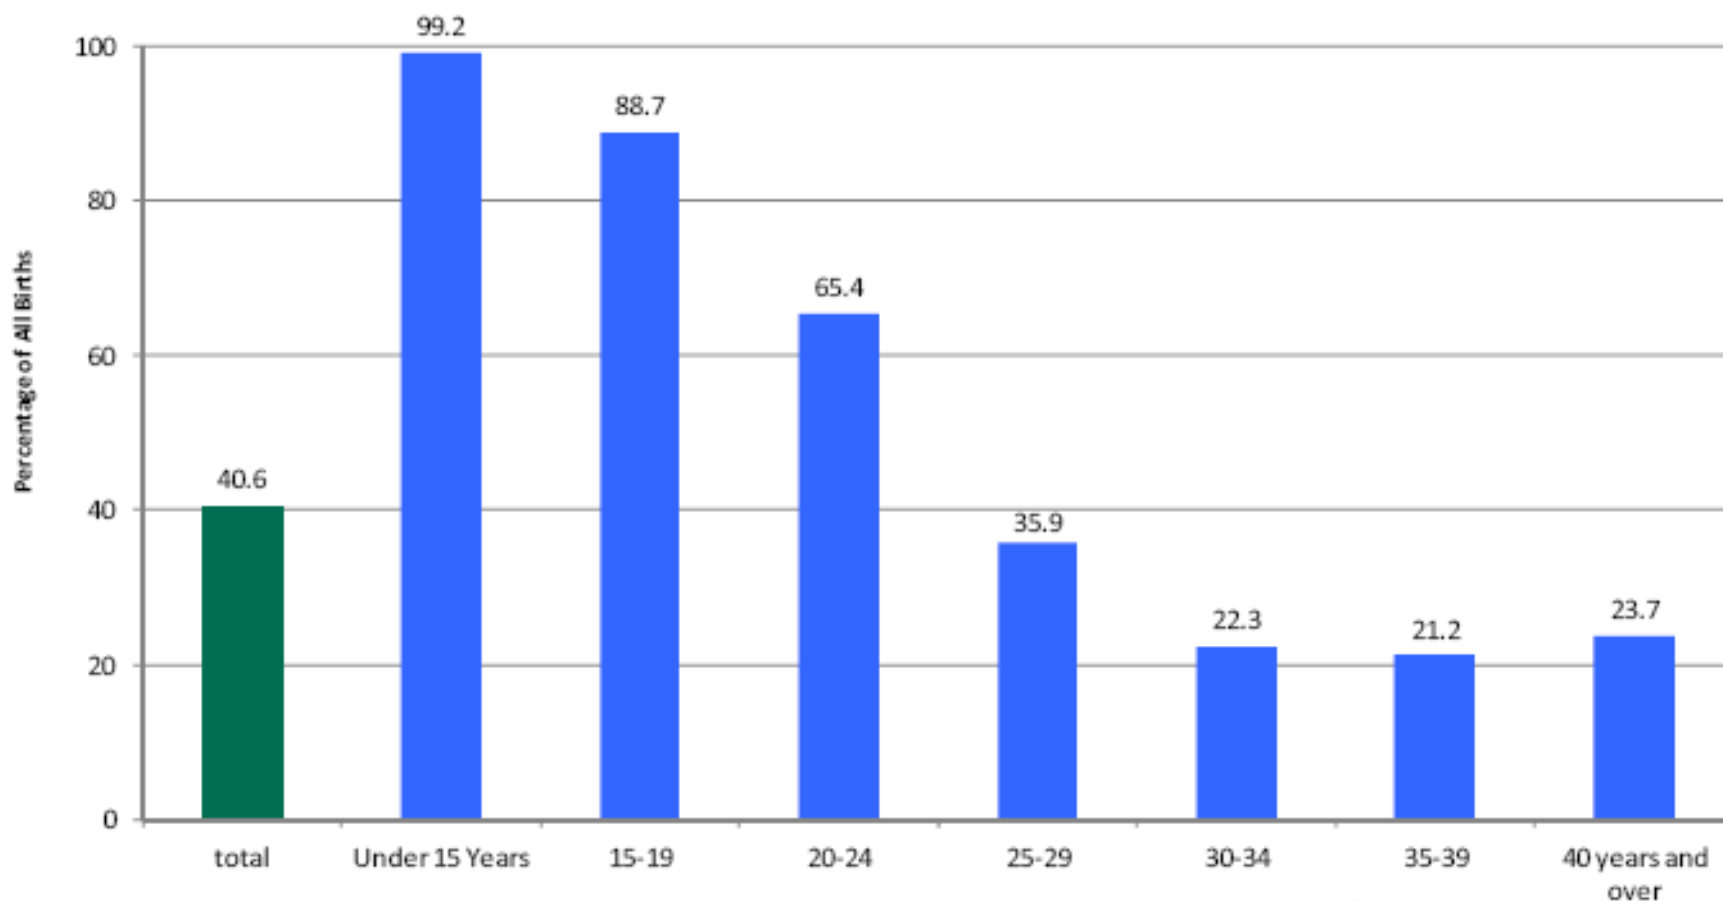

- Some reasons why percentages of births to unmarried Black mothers are so much higher than White percentages
- Of the 72% of the births to unmarried Black women, 30% of the women are cohabiting
 - There is a father helping to raise the child along with the mother
- The availability of black men is low
 - 1.5 million of the 8 million black men in the ages 25–54 are not available for the black women, due to incarceration and high mortality

Age of mother

- The older the woman, the more likely she has married
- The older the woman, the less likely she is not married when she gives birth
- Percentage of births to unmarried women by age of mother when children were born...

Births to unmarried women by age of mother, United States, 2013

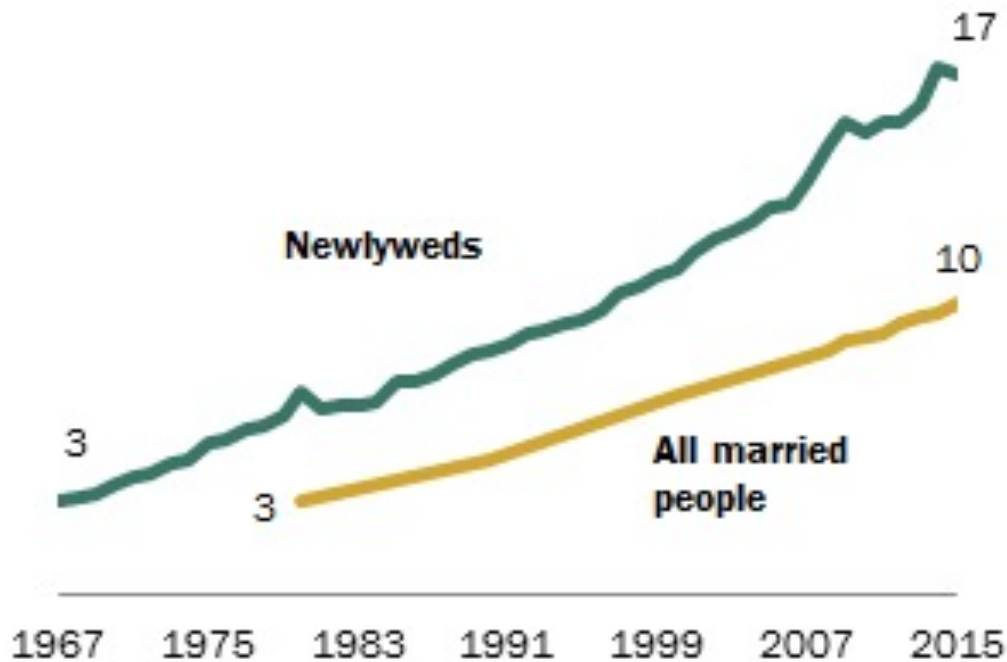

Source: Child Trends, 2015: 4 (reprinted with permission of Child Trends).

5. Interracial marriage

Since 1967, a steady rise in intermarriage in the U.S.

% who are intermarried among ...

Note: Data prior to 1980 are estimates. See Methodology for more details. For "all married people," 1980, 1990, 2000, and 2008-2015 data points are shown.

UNIVERSITY.

Sexuality

- Essentialism (based in biology)
 - Dimorphism: an “essential” biological or psychological characteristic common to all persons and distinguishes them as either of one sexuality or not
 - A fundamental drive for one’s inclusion into, or not into, heterosexual or homosexual
- Social constructionism
 - Against the notion of binary categories: varying degrees of sexuality
 - Alfred Kinsey and his colleagues moved sexuality research away from essentialism
 - “The Social Organization of Sexuality: Sexual Practices in the United States” (Laumann et al., 1994)
 - The fluidity of sexual orientation

Three dimensions of sexuality

- Self-identification
 - Self-identification of sexuality
- Sexual behavior
 - The actual sexual behavior
- Sexual preference
 - Sexual desire
- All of the dimensions do not necessarily agree with each other

2006–2008 NSFG sexuality data

- Intersectionality between the three dimensions
 - The NSFG uses ACASI (audio computer-assisted self-interviewing) for more complete and reliable data
- Self-identification dimension
- Behavioral dimension
 - Heterosexual: having only opposite-sex partners and no same-sex partners
 - Homosexual: having only same-sex partners and no opposite-sex partners
- Sexual preference: desire dimension
 - Heterosexual: those who are only attracted or who are mostly attracted to the opposite sex
 - Homosexual: those who are only attracted or who are mostly attracted to the same sex

Outcomes based on NSFG data

1. A homosexual (or a heterosexual) response only to identification
2. Only to desire
3. Only to behavior
4. To both identification and desire
5. To both identification and behavior
6. To both desire and behavior
7. To identification, desire, and behavior

Empirical analyses of sexuality

- 2.43% (179 out of 7,356) of the females gave a “homosexual” response to at least one of the three dimensions
 - Self-identifying as homosexual
 - Having same-sex sex in their lifetimes
 - Desiring or being attracted to same-sex persons
 - For males it was 2.87% (176 out of 6,139)
- 17.62% of the female homosexual sample reported all three dimensions
 - For males it was 28.69%

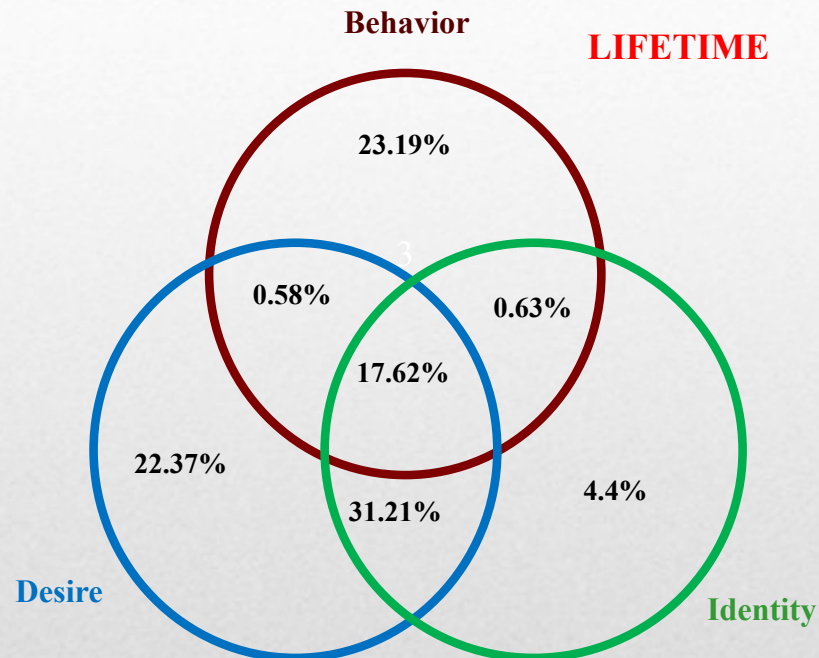

Homosexual females

Interrelations of Components of Homosexuality, females, U.S., 2006-2008

Categories	(%)
Behavior	23.19
Desire	22.37
Identity	4.40
Behave & Desire	0.58
Behave & ID	0.63
Desire & ID	31.21
Beh. & Des. & ID	17.62
Sample Size	179
% of total sample (unweighted)	2.43

Homosexual males

Interrelations of Components of Homosexuality, males ,U.S., 2006-2008

Categories	(%)
Behavior	12.66
Desire	13.53
Identity	4.27
Behave & Desire	0.82
Behave & ID	0.00
Desire & ID	40.03
Beh. & Des. & ID	28.69
Sample Size	176
% of total sample (unweighted)	2.87

Source: Poston and Chang, 2015. Figure prepared by Yuting Chang.

Essentialist vs. Social constructionist

- Essentialist approach works for heterosexuals
 - 71.54% of females, 79.09% of males are heterosexual on all three questions
- Essentialist approach not working well for homosexuals
 - Homosexuality is much more fluid than heterosexuality
 - An essentialist interpretation places the percentage levels of homosexuality much lower
 - Social constructionist orientation provides a much more encompassing understanding of sexuality

U.S. prevalence rates, 2006–2008

- Heterosexuality

- Females

- 95.43% of woman aged 15–44 gave a heterosexual answer to at least one dimension
 - 71.54% gave heterosexual response to all three questions

- Males

- Corresponding percentages were 95.77% and 79.09%

- Homosexuality

- Females

- 1.86% of woman aged 15–44 gave a homosexual answer to at least one dimension
 - 0.33% gave homosexual response to all three questions

- Males

- Corresponding percentages were 2.24% and 0.64%

Female and male heterosexuality, United States, 2006–2008

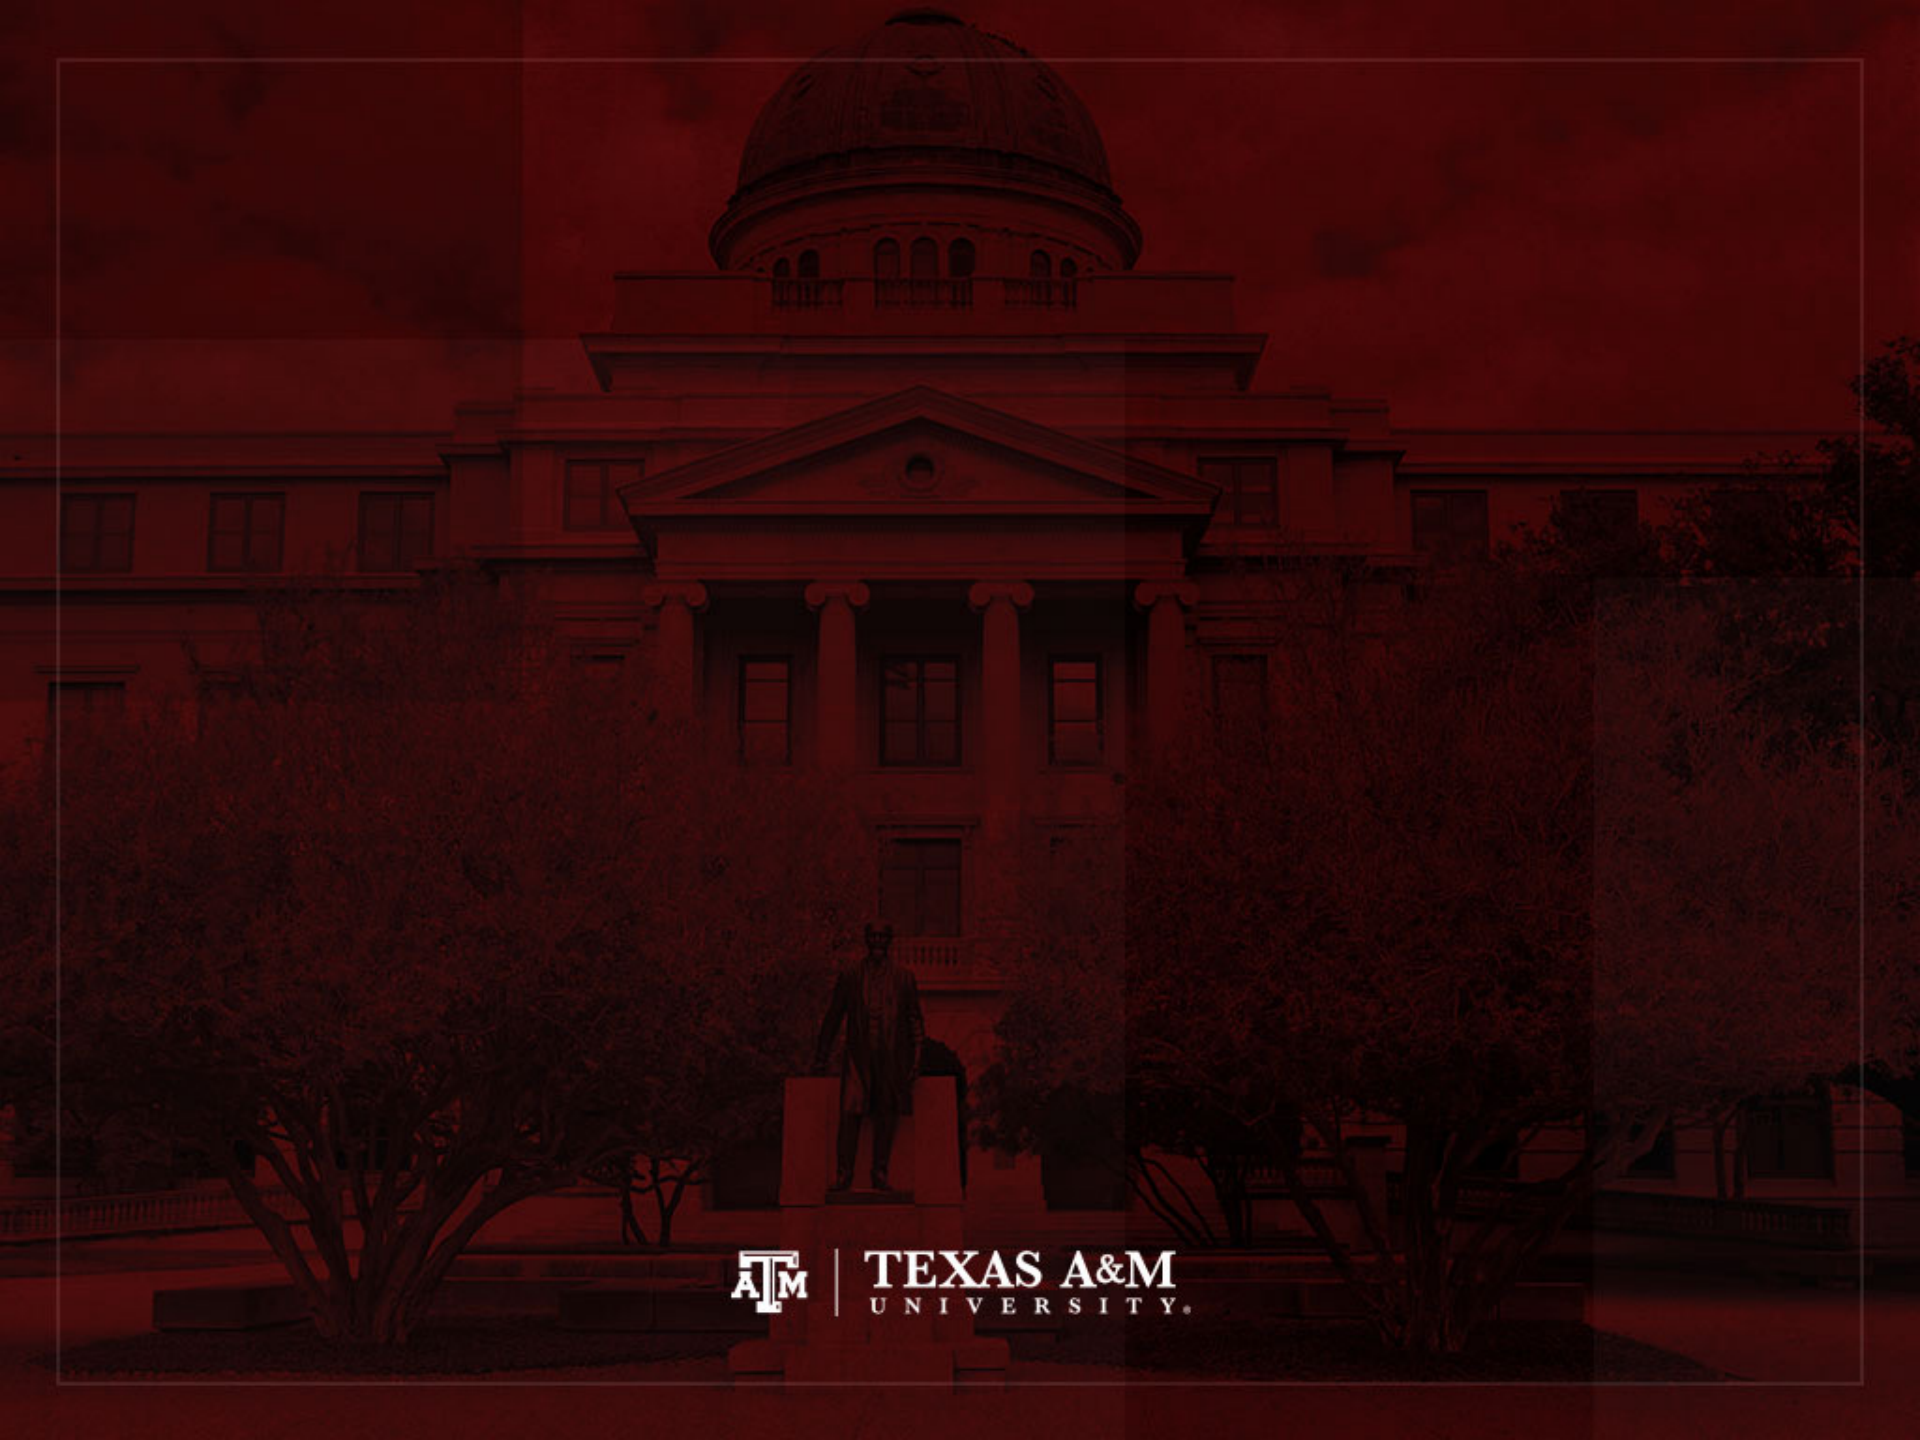

Heterosexuality	Females		Males	
	%	Margin of error	%	Margin of error

Family partnering

- Four types of family partnering
 - A married or cohabiting male and male
 - Gay partners
 - A married or cohabiting female and female
 - Lesbian partners
 - Two persons living together as a married male and female
 - Opposite-sex married partners
 - A cohabiting male and female
 - Opposite-sex cohabiting partners

2010 Census questionnaire

1. Print name of **Person 2**

☐

Female

Analysis of 2010 Census

- 366 metropolitan areas in the U.S.
- Estimate prevalence indexes for each type of partnering (Gates and Ost, 2004; Poston and Chang, 2013)
 - Ratio of the proportion of each type living in a metropolitan area to the proportion of all households that are located in a metropolitan area
 - They measure over- or underrepresentation of each type of partnering in a geographic area relative to the population

Interpretation of indexes

- Index equal to 1.0
 - Partnering type is as likely as a randomly selected household to locate in the metro area
- Index above 1.0
 - Partnering type is more likely to live in the metro area than a random couple household
- Index below 1.0
 - Partnering type is less likely to live in the metro area than a random couple household
- Percentage interpretation: $(\text{index} - 1) * 100$

Prevalence ratio

- Prevalence ratio index for gay partners: 0.69
 - In the “average” metropolitan area, gay couples are 31% less likely to live there than would be a couple from a randomly selected metropolitan household
- Lesbian partners: 0.86
 - 14% less likely to live there
- Opposite-sex married partners: 1.02
 - 2% more likely to live there
- Opposite-sex cohabiting partners: 1.03
 - 3% more likely to live there

Means, standard deviations, maximum, minimum values for several indexes, U.S., 2010

Rate	Mean	Standard deviation	Maximum value	Minimum value
Gay Male Couples Index	0.69	0.31	2.78 San Francisco, CA	0.26 Grand Forks, ND-MN
Lesbian Couples Index	0.86	0.37	2.97 Ithaca, NY	0.32 Wausau, WI
Opposite-sex Married Couples Index	1.02	0.09	1.46 Provo-Orem, UT	0.78 Gainesville, FL
Opposite-sex Cohabiting Couples Index	1.03	0.17	1.63 Lewiston-Auburn, ME	0.34 Provo-Orem, UT

Geographic distribution

- Same-sex couples have uneven distribution in the U.S.
- Gay male couples are much more likely to be in some areas than in other areas
- Lesbian couples are more concentrated in metropolitan areas in general than gay male couples
 - But they don't prefer particular cities as gay men
- Opposite-sex couples are the majority of couples in any metropolitan area
 - They are just about as likely to reside in any of the areas: ratio around 1.0
 - Especially married couples: min. & max. values are closer to 1.0

Support of same-sex marriage by age
